

Story Title: *The Lost Presentation File*

1. Concrete Experience (What happened?)

Last Monday, just an hour before the semester's final project presentation, Priya realized her laptop wouldn't turn on. All her slides, demo files, and notes were on it. After a moment of panic, she borrowed a friend's laptop, logged into her email, and luckily found an older version of her presentation saved in the cloud. It wasn't perfect, but she managed to deliver on time.

2. Reflective Observation (What did you notice?)

Priya noticed that while her quick thinking saved the day, she had been overly dependent on one device. She also realized the older version lacked the new visuals she'd worked hard on, which made her presentation less engaging than she had planned. The stress of last-minute scrambling also affected her confidence while speaking.

3. Abstract Conceptualization (What did you learn?)

She learned that relying on a single copy of important work is risky. Keeping multiple backups — and updating them regularly — is not just a "good idea," it's essential. She also learned that mental preparedness matters: confidence comes not only from good content but from being ready for unexpected changes.

4. Active Experimentation (What will you do next?)

Priya decided she will always keep her project files synced to at least one cloud storage service and an external USB drive. She will also rehearse using a backup version so she's comfortable presenting even if the "perfect" version isn't available. From now on, she sees backup planning as part of her project work, not an afterthought.
